

Managed File Sharing Platform

Secure exchange of files

The noris network file sharing system is the preferred solution for cross-team working on files based on Storgrid. Save files in your own private cloud, control access of shared content and synchronize the files with your - across all locations, regardless of operating system and location!

Benefits

- Connection to customer's own Active Directory or LDAP server on demand facilitates the user management and reduces the administrative effort
- Various access options via Windows client, Mac OS, Linux, web interface or via a smartphone (iOS or Android)
- Offline capability by synchronizing the files with the clients
- Controlled access through individual management of folders and rights, as well as individually configurable external read accesses
- Secure hosting in a certified German data center with German Federal Data Protection Act (BDSG) compliant data processing
- Highest Security through virus scanner for systems without file encryption, firewall, encryption of access and optional encryption of files

Highlights

- Connection of own Active Directory on request
- Encrypted access
- Including Backup if desired
- Central administration of mobile devices
- Automatic e-mail notification when Shares are opened
- Individual folder and right administration
- 24/7-operation by ISO/IEC 20000-1- certified professionals
- Own admin accounts for user management

Details

The noris network file sharing systems are the solution for a safe, team- and inter-site exchange of files based on Storgrid. All systems are located in certified, high-security data centers in Germany - giving you full control over your data!

The systems are connected to a highly redundant and site distributed storage system. The size of the available storage is not limited. You just pay as much as you use. Optionally you receive a report about the occupied storage every month. If desired, you can set the maximum size of files that can be stored on the system. The system is limited in this respect only by the available memory.

Almost all current operating systems and mobile devices are supported. For the use of mobile devices central policies can be assigned, if necessary, it is even possible to disable them.

Systems without file encryption are equipped with a virus scanner. Thus the security of the system is enhanced even further by scanning the documents „live“ during the upload, if malicious software should appear, an upload of the file is not possible. In addition, the stored files get scanned on a daily basis to completely exclude malicious software. You will receive a report about the findings by e-mail.

The folders can be individually created and managed, so that individual external read requests can be enabled. On request you receive e-mail notifications about this external read accesses. Windows, Mac and Linux clients can be synchronized with the folders so that the data are also available offline. The connection of an Active Directory server is also included on request, thus the user administration is far easier for your administrators. Through self-management, you can create and delete any user, and dispose of the allocated memory. If you want to create more than the included users without a problem, the additional users will simply be billed in a linear way.

The access is encrypted to guarantee the security at all times. Optionally your system can be equipped with an ABE (= Attribute Based Encryption) which makes a 256bit encryption of your files. Documents are always opened in a separate container on a client and a new private key is retrieved from the server during every individual login, which can only be used in that moment for that specific user, and its PIN code, for that specific device, for that specific session.

If you want to have a backup of the stored files, this function can be activated on request without additional costs. You only pay the additional memory required by the backup.

Defined key users will be supported in case of an incident, but also client support is available, the accounting will be done according to the effort.

System Variants							
Included User-Accounts	20	50	75	100	250	500	1000
Admin-User	1	2	2	3	3	5	5
Key-User	1	2	2	3	3	5	5

Feature	Version
Operating systems for access	Windows Client, Linux, Mac OS
Smartphone access	iOS, Android with additional Client
Offline ability	Windows, Linux, Mac OS
Virens scanner	daily and on-access scan. Requirement is a system without file encryption.
Backup	on request (only the occupied storage will be accounted)
Encryption	HTTPS, optional ABE-encryption for all stored data
Maximum file size	any limit adjustable
Traffic	inclusive
