

# Web Application Firewall

Security for your web applications

Unprotected web applications are the easiest entry point for hackers and therefore require special protection. With noris' WAF we do just that and protect your web applications securely against attacks.

## Benefits

- Use of information based on the latest vulnerabilities, bots as well as suspicious URL and data patterns
- Use of special heuristic detection engines
- Observation and adaptation to current attack vectors
- Secure protection of web applications from the OWASP Top 10
- Extended avoidance of false positives
- Communication with the developers of your web application

## Highlights

- Layer 7 load balancing
- SSL offloading
- Analysis of HTTP traffic
- Detection of behavioral attacks
- Protection against advanced threats such as
  - cross-site scripting,
  - SQL Injections,
  - tampering or
  - cookie poisoning.

## Details

From the point of view of IT security, web applications are potential weak points that require special protection. That's why we offer the Web Application Firewall (WAF), a virtual solution that securely protects applications from threats. The WAF analyzes HTTPS traffic to the server and filters out attacks. These can be the OWASP Top 10 or the latest methods such as cross-site scripting, SQL injections, tampering or cookie poisoning. It also includes WAF layer 7 load balancing and SSL offloading for more efficient application deployment. The data throughput can range from 25 Mbit/s to 2 Gbit/s, depending on the variant.

The WAF is available in the versions „Managed“ and „Full“. In the „Full“ version, the customer receives a daily report with a summary of the alarms and events as well as recommendations for action from noris. Read-only access to the management interface gives customers live access to all current events. We also offer the possibility of a fault-tolerant system.
