# noris cloud Connect

Flexible and powerful

Utilize the full potential of hybrid systems. Benefit from flexible and powerful connections to scalable and automatable cloud infrastructures in your existing setup.

Benefits

- Maximum saftey due to redundant connections, optimized network technology and continuous performance

- Cost-effective connection of your legacy systems to the noris cloud with all important functions of the OpenStack technology

- Data security in the noris cloud through operation in our certified, highly secure and high-performance german data centers

- Flexible scalability to meet your requirements optimally

- Integration of existing systems at noris, customer sites and data centers with the noris cloud via the noris high-performance backbone

- Seamless migration or integration of legacy systems into the noris cloud

Highlights

- Data throughput between 100 Mbps and 10 Gbps

- Allocation of routed layer 3 networks as OpenStack subnet pools in the noris cloud

- Dedicated connection via the noris high-performance backbone

- Constant bandwidths and latencies

- Simple and cost-effective implementation of hybrid systems

noris network

Details

noris cloud Connect makes it easy to establish a powerful connection from your existing infrastructures to the noris cloud. In many cases you can reduce your network costs, increase bandwidth throughput and provide a more consistent network experience. In this way remote locations with dedicated lines can also be connected to the noris cloud. noris cloud Connect is not routed via the public Internet and therefore offers more security, reliability, faster speeds and lower latencies than typical Internet connections.

We provide noris cloud Connect with a data throughput of 100 Mbps to 10 Gbps. You can find a detailed list in the table below. Routed layer 3 networks are used in the noris cloud as OpenStack subnet pools. The number and size of the subnet pools will be coordinated with you upon initial setup. You have the possibility to access public and private resources through the same connection, while maintaining network separation between public and private environments.

Data throughput:				
100 Mbit/s	200 Mbit/s	500 Mbit/s	1 Gbit/s	10 Gbit/s
